BUSINESS CENTRAL · AGENTIC DEV FRAMEWORK · V5

AI-built BC Apps. Done Right.

Simple enough for Functional Consultants. Robust enough for Pro Developers.

WORKS WITH or +

ajansari.github.io/ocpfBcAgenticDevFramework

AJ ANSARI · MICROSOFT MVP

Vibe coding doesn't belong in business-critical apps.

AI can write AL fast. Without the discipline of a professional developer it also writes technical debt fast.

Goal	Let a Functional Consultant work with an agent the way they would with a BC developer.
Bar	The same quality of work and the same outputs a professional would deliver.

Four phases. Every step gated.

Foundation

Project parameters, FRD in business language, then a TDD that stands on its own.

Code Generation

Batches generated in parallel by sub-agents, symbol-verified lint, until every planned batch exists.

Compile, Deploy & Test

Compile and package, you install to a sandbox, test, diagnose, fix. 0 errors, 0 warnings.

Code Review & Release

Gap-fit against FRD and TDD, A–F code review scorecard, documentation, release package.

One runbook powered by a backbone agent.

The main agent walks every step in order and spawns sub-agents where needed, each with its own model and effort, for specialized tasks or a second set of eyes.

WHY IT FITS FUNCTIONAL CONSULTANTS

You bring the business knowledge. The runbook supplies the sequence, the gates, the documents, and when to stop and ask.

Three roles. Model and effort chosen per role.

Main	The backbone. Owns the code and the continuity documents from PRE-01 to production.
Light	Fast, cheap passes: pre-flight checks, formatting, lookups.
Reasoning	Deep passes: design review, root-cause diagnosis, a second set of eyes.

Recommended in Claude Code: Sonnet · Haiku · Opus. Every step measured: tokens and cost per model, or AI credits in GitHub Copilot.

Full, Lite, or Build-a-Feature. Same AL standards.

FULL

14 steps · 19 docs

For substantial projects. Every phase, every gate, every document.

LITE

7 steps · 4 docs

For projects of 10 files or fewer that need to move fast.

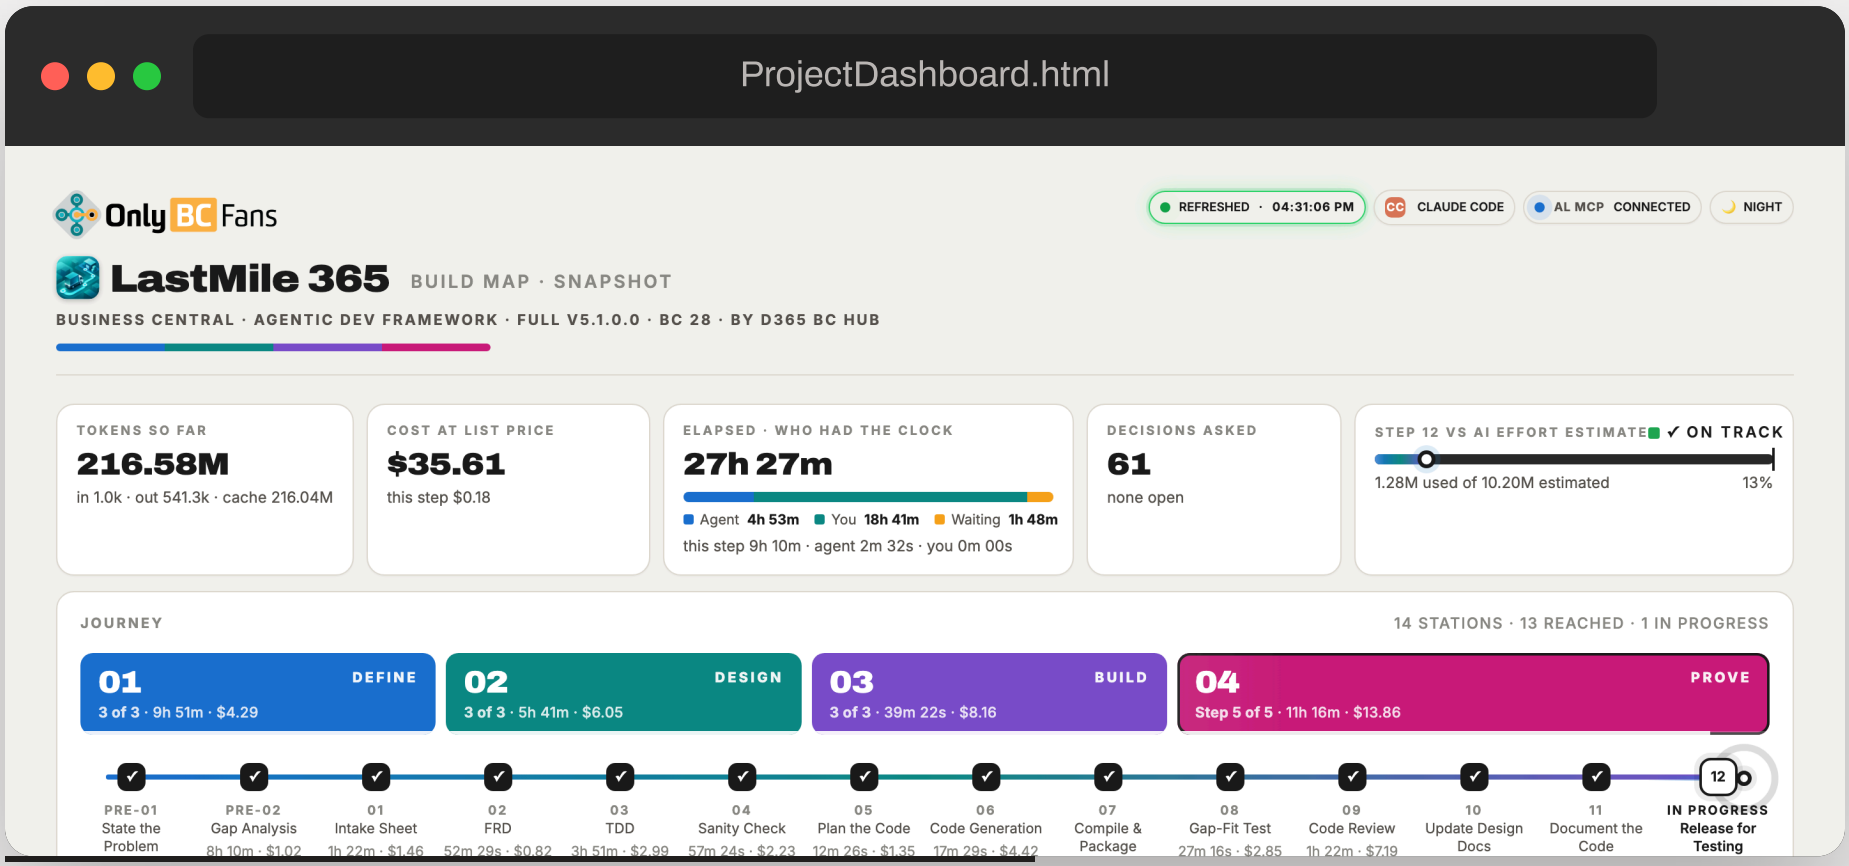

FEATURE

No steps · 4 quick docs

One object or a few, in a new or existing extension.

New: Build-a-Feature is the quick mod that is not a project at all. One question, fields confirmed in one box, AL compiled clean, next object offered. Recommended first on an existing extension.

Every project gets a Build Map.

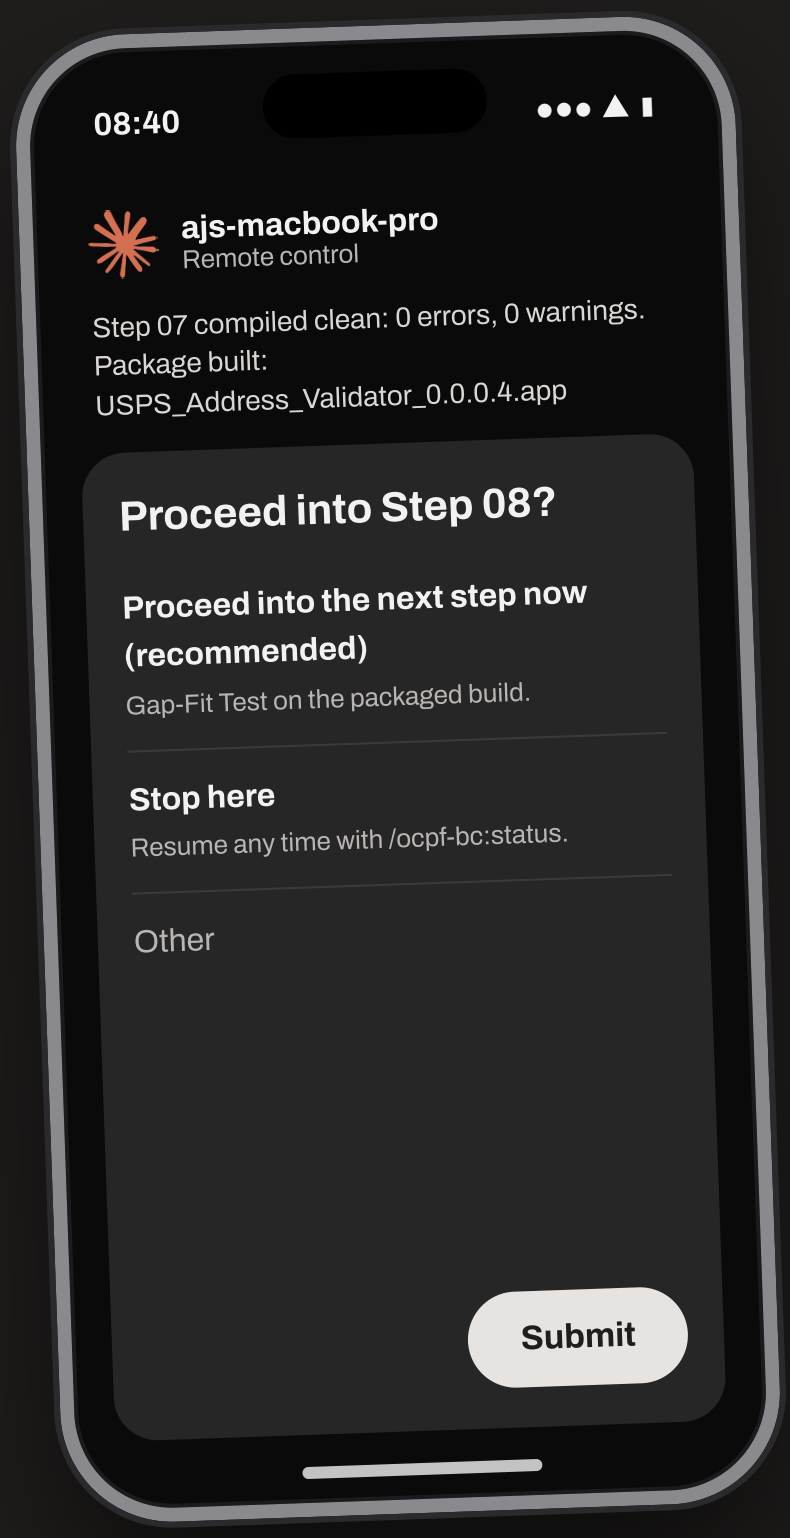

Phase and step, tokens and cost against the estimate, elapsed time split, models at work, and the open question when it is your turn. Refreshes after every agent turn, no tokens spent.

Your turn, wherever you are.

After the first hour the agent works in long stretches and comes back only to approve, decide, or ask.

With Claude Code Remote Control, the question reaches your phone and you answer it there.

CLAUDE CODE ONLY

Install the extension. Open your project. Type one command.

/ocpf-bc:start

Or just ask: *“Start a Business Central project with the OCPF framework.”*

Now in the **Visual Studio Code Marketplace**. One install brings the AL toolchain and both agents.

Helps you choose Full, Lite, or Build-a-Feature, and installs the latest runbook

Connects Microsoft's AL tools, with nothing to install

Source-available. Free to use. Ready today.
